

Coley's Gin and Fertilizer - Vienna, Georgia

Chuck Coley (right) takes a moment to rest and pose with Andy Bowen (middle), his gin superintendent of many years, and Carey Cook (left), the project electrician from Cook Industrial Electric, following successful commissioning of Coley's new Collider Drying System.

Andy enjoys the way he does not have to run the unloading fan for moduled cotton, yet the conveyor arrangement passes all cotton through the Hot Box II for rock separation and automatic moisture sensing.

A Moisture Mirror with 10" Screen sets drying temperature automatically based on the incoming cotton's moisture level sensed at the Hot Box II (see above). In addition, the moisture after drying is displayed and a yellow bar graph shows Andy the volume of cotton flowing to the gin from the module feeder.
