

# CROSSFLOW DRYER

## *This Dryer Uses Performance & Efficiency to Boost Your Bottom Line...*

Processes that require a drying phase normally have three priorities:

- Maximizing the value of the product
- Maximizing production throughput
- Minimizing energy costs

***The Crossflow Dryer addresses all of those factors, positively impacting your profitability!***

Its low pressure drop design, reduces horsepower and enables a high air to product ratio. This approach allows some materials to be dried at lower temperatures, saving fuel.

This dryer has been used on a variety of products, but most extensively with cotton (as pictured below). Its seed cotton rating is 38,500 pounds per hour.

Are you curious about how it would perform on your product? Contact us for information on testing your material at our drying laboratory and use the resulting analysis to predict how the Crossflow Dryer could benefit you.
